In this post, Ill be giving my full and detailed Bias FX 2 Review. I have been using Bias FX for years now. I was previously using the old version of Bias FX and recently upgraded to Bias FX 2. If youre someone who is thinking of getting into the world of Amp Simulator Software, then youve no doubt heard of Bias FX 2. Positive Grid has made quite a reputation for themselves in recent years in the world of guitar VST plugins. In this comprehensive Bias FX 2 Review, Ill break down everything you need to know about the software including the pricing, features, sound quality, overall experience, and comment on whether it can replace an actual guitar rig. Lets get started. So the start of this Bias FX 2 review lets discuss the general pricing structure. There are 3 main pricing tiers; Standard, Professional, and Elite. In terms of sound quality and features, all 3 tier are mostly identical. However, as you upgrade to the higher tiers, youll have access to more amp models, effects pedals, cabs and impulse responses, racks and more. Here is a table that breaks down how much Bias FX 2 costs and some of the key differences between the different pricing tiers. *Note that pricing is subject to change FeatureBias FX 2 ElitePrice$59.00$119.00$179.00Audio Plugin VersionStandalone VersionFactory Preset70130210Amp Models3060Effects 43115122Rack1418Target Guitars in Guitar Match4820 For this Bias FX 2 review, I wanted to specifically discuss the overall setup process. This is something that is often overlooked when reviewing amp modeling software, but I think its important to have software that is accessible, easy to set up, and compatible with a wide range of equipment. After all, if the software is a pain in the butt to set up and requires high-end equipment to use, then it detracts from the overall accessibility and experience. The main reason Ive used Bias FX for all of these years is simply because of how easy it is to get set up on all of my devices at the same time. So, lets get into the actual setup process. Here is a quick video that walks through the tech setup. First, here are a few items that youll need to get started using Bias FX: Electric GuitarAudio InterfaceComputer (Mac or PC)Digital Audio Workstation (Optional) For the most part, its pretty straight forward. Youll obviously need an electric guitar and computer to get started. Any electric guitar or laptop will work. Bias FX is compatible with Mac or PC and doesnt require high-end specs, no you dont need to buy new computer equipment. One thing that youll probably need to purchase if youre new to using amp modeling software is an audio interface. This is what youll use to connect your guitar to your computer. I would recommend the Focusrite Scarlett Solo. It has excellent build quality, industry-leading preamps, plug and play USB setup all at an affordable price tag. Focusrite Scarlett Solo (3rd Gen) USB Audio Interface The Focusrite Scarlett Solo is one of the best audio interfaces for beginners who want to get started recording music from home. Excellent build quality, plug and play setup, and industry leading pre-amps. Buy on Amazon We earn a commission if you click this link and make a purchase at no additional cost to you. Finally, youll need a Digital Audio Workstation to record music with Bias FX 2. On Windows, Id recommend using Reaper and if youre on Mac, you can just use Garageband. Since Bias FX 2 is a guitar VST plugin, you can just load Bias FX directly into your DAW and record music from there. Alternatively, you can just use Bias FX 2 as a standalone application on your computer. This makes it very accessible since you dont need extra software to use it. This is useful if you just want to jam, but arent trying to record anything. In terms of the actual setup process, its very easy and straightforward. Youll just need to connect your guitar to your audio interface and plug it into your computer via USB. Then, within the Bias FX 2 software (standalone) or within DAW, just select your audio interface as your main recording device and playback device. Next up in the Bias FX 2 review is the overall user interface. Since the design and user interface is actually how youll be interacting with the software and dialing in your tones, its important to have something that is intuitive and more importantly, fun to use. I can honestly say that the UI was one of the main reasons I decided to get Bias FX 2 in the first place. It has a stunning design that is intuitive and easy to navigate. I love the way your whole signal chain is laid out in front of you. All of the different amps, effects pedals, and cabs are all drag and drop elements. You can move them around in the signal chain simply by dragging and dropping them. Also, the layout of all the different pedals and amps is neat and organized, which is important since there are literally hundreds of them. I was easily able to find the ones I needed because they are categorized properly. All in all, I think Bias FX 2 does a great job of emulating how a guitar rig functions. If youre a guitar player with an actual rig, then transitioning to Bias FX is seamless. Youll feel right at home, which is probably the best compliment I can give it. Well, I think its about time we get into the meat of this Bias FX 2; the features. Bias FX 2 is probably one of the most feature-rich amp modeling plugins Ive ever used. There are an incredible amount of options to choose from, most of them being practical, while others are just simply for fun. Lets talk about all the features. Quite possibly the most important feature in this Bias FX 2 review is the different amp models. After all, you cant have a good amp modeling plugin without good amp models. So, how does Bias FX 2 fare? Well, simply put, AMAZING! I have been using Bias FX for years and Bias FX 2 really takes it to the next level in terms of the number of amp models and the overall quality of them. In total, Bias FX 2 has 100 amp models if you opt for their elite version. The Professional version has 60 different amp models and the standard version has 30. I found that the software including the pricing, features, sound quality, overall experience, and comment on ToneCloud. Also, if youre a bass player, the dedicated amps on standard versions are VERY limited. As a result, Id probably opt for either the professional or elite version if you can swing it. If you get the elite version, youll want to use all of the amps on there, but its nice knowing that you can download any preset from the ToneCloud and know that it will work with your version. But in terms of the actual amp models themselves, theyre all phenomenal. They offer everything you would expect including versions of iconic amp models for your Mesa Boogie Dual Rectifiers, 5150s, Plexi, Vox AC30, Marshall JCM800, and many more. And they all sound amazing. In terms of accuracy, they are extremely close to the real thing. Youd be hard-pressed to distinguish the difference in a mix. Obviously, these amp models wont perfectly capture the feel and dynamic response from a real tube amp, but the fact that you have access to 100 different amps with a click of a button makes it worth the tradeoff. You really cant beat the convenience. In addition, Bias FX 2 seamlessly integrates with Bias AMP 2, allowing you to import all of your custom created amps and apply your different effects to them. Your cabinet and mic options are arguably just as important as the amps themselves. If you have a good sounding amp simulator, but a terrible cab and mic, your sound will inevitably sound weak and lifeless. Also, if youre using an amp simulator plugin, youre trying to emulate an entire sound, not JUST the amp. And whenever you use an amp, you need to pair it with a good cab and mic as well. Happy to report that Bias FX 2 has excellent options for cabs and microphones as well. Youll have access to dozens of different cabinets, speakers, and microphones with high-quality Celestion Impulse Responses. On the Professional and Elite versions, theres actually an IR loader, which allows you to import your own impulse responses, which is a neat feature. I really love the interface when it comes to micing up your amp in Bias FX 2. Its really cool being able to pick 2 different microphones and actually moving them into different positions on your amp. It really adds to the immersion and actually affects the tone pretty drastically. It adds a whole other layer, allowing you full control to dial in the perfect tone for your needs. Now, lets move onto the effects pedals portion of this Bias FX 2. And as the name would suggest, the effects pedal is the main differentiator between Bias FX 2 and Bias AMP 2. Bias FX 2 has significantly more effects pedals that allow you to craft your complete sound in one package. As a result, I think Bias FX 2 is a much better standalone package than Bias AMP 2 because you have access to everything you need to create your tone including amp models, cabs, AND effects. Whereas, Bias AMP 2 really only focuses on creating your own amp model. That said, these two are meant to integrate seamlessly, allowing you to create your perfect amp in Bias AMP 2 and import it over to Bias FX 2 so you can further enhance your tone with different effects. Bias FX 2 has a wide array of different renowned analog and digital effects pedals. Theyre pretty much all modeled after real effects pedals, so youll feel right at home. Its actually pretty easy to emulate your entire real-world pedalboard right in this single piece of software. Youll have access to noise gates, compressor pedals, boost pedals, distortion pedals, EQ, modulation, delay, and reverb pedals. And at that, there will actually be several different options for each type of pedal, meaning there is essentially an unlimited number of combinations you can make when you factor in all of the different amps and cabs. I also really like how the effects are applied as well. You can simply drag and drop each pedal where they belong in the signal chain, similar to a real rig. You can turn them off to bypass them if you want them in your loop, but want to disable them. I cant even begin to describe how much more convenient it is to drag and drop effects pedals is versus having to completely remove a pedal off of your pedalboard and fix the cable routing in a real setup. Overall, the effects pedals are amazing. They sound great, are easy to configure and work exactly as intended. If youre using Bias FX 2 in your DAW to record, you can actually just use Bias for the effects pedals alone and use a different plugin for your amps if so choose, which is pretty neat. If were reviewing Bias FX 2, we need to talk about Positive Grids new flagship feature, Guitar Match. Guitar Match is a feature that aims to take amp simulation to the next level by simulating the actual guitar itself. All guitars sound different. And Guitar Match tries to simulate the tone of some of the most iconic guitars in world, allowing you to replicate the exact sound you want regardless of the guitar youre using. You have a cheap $150 starter guitar, but want it to sound like an authentic Gibson Les Paul? All you have to do is select the Gibson Les Paul and Bias FX 2 will apply that sound to your guitar tone digitally. I must admit, I was pretty skeptical when I first heard about this feature. To me, it seemed a bit like a gimmick. After playing around with the Guitar Match feature a while, here are my thoughts. There is an obvious difference in sound. Well, yes and no. I must say I was actually pleasantly surprised at some of the tones I was able to get. It actually does a pretty good job of capturing some of the key characteristics of these iconic guitars. For example, if you select a Fender Telecaster, it actually does a good job of replicating the iconic twang tone that telecasters are known for. If you choose the Gibson Les Paul, it makes your tone a lot meatier and warm. I must say, it was actually pretty fun playing around with the different guitars that are available in the software, just to see how it would handle it. Keep in mind that I was using the exact same guitar the entire time just to see how the software itself would render the tone assuming the input was exactly the same. But would I actually use this in an actual recording? Absolutely not. Not too much of a surprise, but I definitely dont think the Guitar Match is able to replace a real guitar. Overall, I think its fun to play around with the different options to see what type of cool tones you can get. I can definitely see myself using it in casual jam sessions. However, you can clearly tell that the tones are synthetic. They sound a bit too processed and unnatural compared to the sound of the real guitar that the amp sim is trying to emulate. You could argue that most people probably wouldnt notice in a mix. But I still cant really see myself using the Guitar Match feature in an actual recording. In almost all cases, youd be better off just dialing in the proper tone with the guitar you already have to fit the specific situation. Itll sound a lot more natural than artificially changing the sound of your actual guitar. Moving along with this Bias FX 2 review, lets talk about what could possibly be my favorite feature of all, Tone Cloud. Tone Cloud is Positive Grids online community that allows users to create, share, and download different presets from other users. Positive Grid also partners with various famous artists as well to create custom presets that match that specific artists tone as well. If youre like me, then dialing in tones is a chore. There are so many options to choose from that it can be difficult to dial in the perfect tone if youre not knowledgeable on the various types of gear, or lack ear training. Tone Cloud makes it easy to just download other users presets natively in the application. This is very unique compared to other amp sim software where you need to go to an online forum, download a preset file, and import it. Having a collection of presets at your disposal from experienced users is such a powerful tool. I dont think Ive ever made a preset from scratch. I would rather just download one that someone else created and then slightly tweak it from there. It saves a lot of time and ends up sounding a lot better. The only issue that you might run into is if you have the Bias FX 2 standard or professional tier package. Since these versions dont have access to all of the amps, effects pedals, and cabs, if you download a preset that requires one that you dont have, the preset wont be compatible. This is why I upgraded to the Elite tier, just so I could have the peace of mind of downloading any preset from Tone Cloud. Overall, I love the Tone Cloud feature. It makes it SO much easier to get an excellent sounding tone without having to dial it in yourself. Now that weve covered all of the main features in this Bias FX 2 review, lets get into what really matters. How does it sound? In short, Bias FX 2 sounds excellent. I found that the clean tones sound very realistic and at times indistinguishable from some of the actual amps Ive played. One problem that the older version of Bias FX had was that the high gain metal tones were notoriously known for sounding fake. Not fake as in bad, but fake as in it fails to capture some of characteristics of a real tube amp. For example, cranking the master volume wouldnt actually sound airier like a real amp. Bias FX 2 is a huge step up. While the high gain tones might not pack as much punch as a real amp, its hardly noticeable at all in an actual mix. Does this guitar VST plugin actually sound good enough to replace your real guitar rig? Well that depends on what your needs are. For me, I stopped using real amplifiers years ago in place of amp simulators. While there are amp purists who swear by real guitar rigs, personally I dont find enough of a sound difference to justify keeping my real rig. The convenience of being able to record right on my computer, re-amping to change the tone after Ive already recorded, and just having access to hundreds of amp models all in the same place more than make up for it. Here are some sound samples of some different presets in Bias FX 2 so you can judge for yourself. So, now lets move onto the more subjective part of this Bias FX review. Here are some of the things that I liked and disliked about the plugin from my personal experience. The main thing that I love about Bias FX 2 is the convenience. I feel like all of the features and options included in here save me a bunch of time in my workflow when Im recording or just playing. Having access to hundreds of different tones is well worth the trade off. So, if you made it this far into the review and are still interested in picking up Bias FX 2, click the button below for 40% off your purchase for a limited time. Good Luck! Positive Grid offers the BIAS FX 2 LE guitar processing software as a FREE download for a limited time.Nothing ushers in the weekend better than a free plugin. Guitarists, bassists, and folks that just love distortion can all grab Positive Grids BIAS FX 2 LE for free for a limited time.BIAS FX 2 LE is a slimmed-down version of the full version and comes with a much smaller assortment of amps, cabs, and effects. What is on offer is good enough for most scenarios you can dream up for various genres. There are amps to choose from, mid-gain, and high-gain.Famous amps, like the Marshall JCM800 and the Mesa Boogie Dual Rectifier, are present. The other amps are likewise famous examples, like a boosted Vox AC30 or Roland JC120.The cabs match up with the selection of amps and come with a variety of mics to select from.BIAS FX 2 LEs included effects are typical of what youd expect for guitar processing. There are options for overdrive, distortion, modulation, delay, and reverb.If there is one weak area for BIAS FX 2 LE, it is the cab modeling. Ive been an on-and-off BIAS user for years, and I end up just loading my preferred IRs or using a different cab sim.The recently covered MIKKO2 by ML Sound Labs or NadIR from STLTones both make great options. Pairing an IR loader with BIAS FX gives you quite a versatile combination.It isnt just suited for guitars either, as the different tonal properties evident in each amp can make for lovely inspiration when dialing in synth or keyboard sounds. From personal experience, I can vouch for the power of a modeled Mesa Boogie absolutely destroying a 303 bass line.BIAS FX 2 LE is a great companion to the previously covered Neural Amp Modeler. Having a plugin full of guitar-ready effects paired together with such thorough guitar and bass amp modeling makes for a killer free rig.BIAS FX 2 LE is available for Windows and Mac computers. Supported plugin formats are VST, AAX, and AU. Mac users on Silicon devices will need to run it through Rosetta, unfortunately.Download: BIAS FX 2 LE (FREE for a limited time)More: Last Updated on March 27, 2023 by Tomislav Zlatic. Download Torrent Magnet Link Create the virtual guitar kit of your dreams. Positive Grid is proud to announce the release of BIAS FX 2, the next generation of its renowned BIAS FX guitar amp and effects software. Completely redesigned with a higher resolution DSP engine and hundreds of improvements, BIAS FX 2 delivers the ultimate in responsiveness, detail and truly authentic guitar and bass tones. Key benefits include newly developed exclusive Guitar Match and emulation technologies that virtually transform one guitar into another with astounding realism. An extensive collection of brand new and updated amps, pedals and HD racks gives guitar players unmatched depth and breadth. The new Fuzz, Time and Harmonizer simulators provide unique guitar tones and effects, while the looper and recorder open up new performance possibilities. Thanks to the new interface,which makes accessing the enormous power of the BIAS FX 2 easier than ever, the promise of supreme tone and flexibility is truly delivered. Version of the audio plugin.
