Ballistic nylon fabric is a thick, tough material used in various applications beyond its original purpose as an anti-fragmentation material for military use. Ballistic Nylon: The Ultimate Material for Backpacks and LuggageI've found ballistic nylon to be very good on the market due to its great strength and smooth finish. While the history of this type of nylon dates back to WWII, it has so many variants nowadays that are used in a wide range of applications, as previously mentioned. Like micron count in merino wool, how you judge a ballistic nylon is down to denier counts. But, what does "denier" mean? Denier (just d for short) is the term used to define the fiber thickness of individual threads used to create fabric. The higher this value is, the heavier and sturdier the final product is. The CODE OF BELL X-PAK in 1680d ballistic nylon. The most common denier counts for ballistic nylon are: 1050d, 840d, 525d, and 210d. As mentioned, the lower the denier count, the lighter it gets. For example, 525d is great for daypacks like TOM BIHN Synapse 25, while 210d is perfect for stuff that don't see a lot of abrasion. 1680d, on the other hand, might sound like a better fabric, but it's woven from a large single yarn, rather than two plies of 1050d. This gives the appearance of a two-ply fabric, but actually ages poorer and fuzzes out at abrasion points. It's not surprising that 1680d is mostly made in Asia at half the cost of 1050d. If you've obsessed over enough backpacks like I did, you'll come across CORDURA backpacks, of which I've had experience with using my GORUCK GR1 backpack. So, which is better? Well, no one likes ads, so I got rid of them. To determine which is better, you need to know the differences. There are two significant technical differences between the two. Ballistic nylon made of filament yards which are smooth and slick while CORDURA are texturized, which makes them slightly fuzzy like natural fiber. CORDURA has higher abrasion resistance, while ballistic nylon has higher tear resistance. But as I always mention in my reviews, the abrasion resistance and tear stretch is higher than what most consumers need. Unless you are taking it out to fight wars in the field, it's unlikely you'll ever feel the difference. The only tangible difference that most can feel is the appearance. Because ballistic uses a two-ply weave, which means two yarns woven into one, they are less smooth than CORDURA and carries a rugged texture. Ballistic is also harder to dye, which is why you mostly see black ballistic nylon backpacks. Basically, if you are deciding between the two, I would suggest picking it based on the appearance rather than pull your hair out over the durability. The main difference between the two is mainly in the way that the fabric is weaved. Ripstop is interwoven at regular intervals in a crosshatch pattern, which allows it to stop rips, hence the name. What Ripstop excels in over ballistic nylon is its strength-to-weight ratio and that it has the ability to prevent the spread of small tears. ballistic nylon is often considered the gold standard when it comes to making soft-sided luggage and suitcases, thanks to its exceptional wear and tear capacity. The fabric has a long history dating back to WWII, where it was originally developed for military use to protect airmen from projectiles. This makes ballistic nylon incredibly strong and resistant to abrasion. ##ARTICLEBallistic Nylon: A Durable Material for Luggage Ballistic nylon is one of the most popular materials for luggage because its affordability and durability make it a top choice. However, it has a lot of variables in terms of strength and flexibility. Among them, ballistic nylon is said to be the most popular choice for luggage material, but why? It's stronger than other nylon fabrics and it's remarkably flexible. Ballistic nylon is used in making some of the most expensive suitcases on the market. Ballistic nylon luggage: a durable choice for travelers, but comes with a premium price tag. Generally speaking, if you're looking for luggage made from this type of material, it's mostly found in black. Having said that, it carries an air of professionalism due to its sleek design and sturdy construction. However, one thing to keep in mind is that it weighs slightly more than regular nylon. In terms of buying options, Tumi stands out as a top brand for ballistic nylon luggage. Their high-end products boast excellent quality and design, making them worth the investment. Ballistic Nylon Luggage: A Game-Changer for Travelers If you're someone who travels often, whether it's for business or adventure, investing in ballistic nylon luggage could be a game-changer. I can vouch for its high resistance to abrasion, wear and tear, dirt, and even mold. Not to mention, its water-resistant, which is always a plus. Tumi is one of the best brands out there for ballistic nylon luggage, offering high-end design and outstanding quality that truly make for a solid return on your investment. Their bags are mostly made in black, giving them a professional aesthetic that's hard to ignore. Ballistic nylon is stronger than other types of nylon fabrics and remarkably flexible, making it a popular choice for luggage material. Its exceptional wear and tear capacity makes it stand out from other materials, especially when used in military applications. One of the main advantages of ballistic nylon is its ability to withstand tears, punctures, pressure, and damage much better than regular nylon. It's also resistant to scratches and can easily repel water and moisture, making it a great choice for outdoor enthusiasts. However, ballistic nylon luggage can be quite heavy and expensive, which may not be ideal for those on a tight budget. Despite this, its quality and durability make it a worthwhile investment for frequent travelers who want high-caliber luggage that will last them a long time. The primary differences between regular and ballistic nylon lie in their strength and weight. Ballistic nylon is superior in resisting wear and abrasion compared to regular nylon, which is plain woven. Regular nylon, on the other hand, is lighter than ballistic nylon and can be dyed more easily. Ballistic nylon has become a popular material for luggage due to its affordability and durability. While other types of nylon fabric offer varying levels of strength and flexibility, ballistic nylon stands out as a strong contender. Its exceptional wear and tear capacity is largely attributed to its original military use during WWII. This type of nylon fabric was engineered to protect airmen from projectiles and debris. Ballistic nylon fabric is renowned for its exceptional strength and density due to the high-strength and thick nylon fibers. Unlike regular nylon, which offers greater flexibility and can be easily dyed, ballistic nylon boasts enhanced durability. Ballistic nylon's layered construction comprising multiple layers of woven nylon creates an exceptionally robust material. In contrast to Kevlar, which has increased tensile strength but is lighter in weight, ballistic nylon provides superior resistance to abrasion and wear. While originally designed for military use during WWII, ballistic nylon is now widely used in luggage production due to its exceptional durability. Its water-resistance and elasticity make it an ideal choice for outdoor enthusiasts. Compared to other materials like polyester and Cordura nylon, ballistic nylon stands out for its remarkable strength and resistance to damage. With a smooth surface and minimal creases, ballistic nylon luggage exudes a refined appearance suitable for professionals. On the downside, ballistic nylon can be heavier than regular nylon, making it less ideal for long-distance travel in harsh temperatures. Nevertheless, investing in high-quality ballistic nylon luggage from reputable brands like Tumi is worth considering due to its exceptional wear and tear capacity, heat resistance, and chemical resistance. Ballistic nylon luggage can be pricey, making it less suitable for those with tight budgets. However, its exceptional durability and quality make it a worthwhile investment for frequent travelers. The material's high strength and density also result in fewer color options due to challenges in dyeing process. Unlike regular nylon, ballistic nylon is more resistant to wear and abrasion. Regular nylon is lighter but can be dyed with vibrant colors. Ballistic nylon consists of multiple layers of thick, basket-weaved nylon, providing superior resistance to scratches and punctures. It's often found in black due to its dark color palette and professional aesthetic. Its original military use contributes to this trend. Unlike Kevlar, ballistic nylon is not ideal for body armor or bulletproof vests. Investing in ballistic nylon luggage can be beneficial, especially for travelers who need high-quality, durable luggage. The material offers water-resistance and a strong resistance to dirt, mold, and abrasion. You'll mostly find ballistic nylon luggage in black, which gives it a professional look. Although heavier than regular nylon, the benefits of using ballistic nylon far outweigh its drawbacks. For top-notch ballistic nylon luggage, consider Tumi's high-end designs and exceptional quality.
